Target: Platform / DevOps (Self-hosted & Automation)

Summary: Aerospace Engineering (B.Sc.) candidate (expected 09–10/2026) with a build-and-operate mind-set across Linux, containers and automation workflows, backed by customer-side rollout experience at Airbus (requirements, UAT, training, hypercare). Maintains a self-hosted platform with compose stacks, secure remote access and CI runners.

Projects / Experience

Self-hosted Platform (personal project)

Ongoing

- Built and maintain a self-hosted platform for personal/family use: containerized services organized as separate compose stacks with env files and documentation.
- Implemented secure remote access via VPN and HTTPS; configured a reverse proxy for routing and service exposure.
- Operate two self-hosted CI runners separated by privilege (one for container builds; one for automation workflows).
- Integrated automation workflows that can implement changes and open pull requests, with an additional automated review step (AI-assisted).

Consultant (embedded at Airbus) — PLM rollout support

Aug 2023 – Sep 2025

Eurodrone program, Getafe (Madrid)

- Customer-side contributor for an internal platform rollout based on 3DEXPERIENCE: requirements clarification, UAT/validation, and feedback loops with technical experts.
- Primary UAT stakeholders for One Platform were Configuration Management and Systems Engineering.
- Delivered enablement at scale: ~32 sessions over 4 months; trained ~150 users; provided hypercare support post go-live.
- Operated in a high-rigor environment with structured change processes and cross-domain stakeholders.

Formula Student — University Team

Sep 2020 – Dec 2023

- CAD/Configuration Lead: coordinated assemblies, design reviews, drawings, and structured product organization.
- Vehicle Dynamics team member: conceptual design of driverless brake and steering actuators (force sizing, system architecture, supplier catalog research), brake redesign, manufacturing, and track/testing support.

Data Intern (Airbus Commercial) — Skywise (Palantir suite)

Feb 2023 – Aug 2023

- Built ETL pipelines (SQL/Python) in Skywise (Palantir suite) to clean and transform legacy configuration/product-structure data.
- Delivered a product-structure/BOM lookup dashboard in Skywise for engineering queries and change impact discussions.

Education

B.Sc. Aerospace Engineering (UPM) — Propulsion track

Expected Sep–Oct 2026

Additional training: LSE Summer Intensive (1 month) — Introduction to Data Science (R/SQL)

Skills

Linux; Git; Containers (Podman/Docker); Compose; Reverse proxy (Nginx); VPN (Tailscale); CI/CD runners; Workflow automation; Python (foundations); SQL (foundations)

Languages

Spanish (native); English (C2 – Cambridge Proficiency); French (~B1)
